SkillBridge

Real Skill → Real Mentor Platform

UI/UX Case Study

Designed by Monika Choudhary

Problem Statement

Students today are surrounded by courses and tutorials, yet many still feel confused about where to start, what skills truly matter, and how to gain real■world confidence. Most platforms focus on content, not on guidance. There is a clear gap between learning online and understanding what happens in the real industry.

Design Goal

To design a mentorship■driven platform that connects learners directly with real professionals. SkillBridge focuses on human guidance, trust, and clarity rather than paid courses.

How might we reduce the gap between learning and real■world skills?

My Role

UI/UX Designer (Concept Project). I was responsible for the entire design process including research, problem definition, persona creation, journey mapping, storyboarding, wireframing, and high■fidelity UI design.

Process Followed

- User Research & Competitor Analysis
- Problem Definition & Pain Points
- Persona Creation
- User Journey Mapping
- UX Storyboards
- Low■Fidelity Wireframes
- High■Fidelity UI Design

Understanding the User

Research was conducted through informal interviews, online discussions, and analysis of existing platforms such as LinkedIn, ADPList, Coursera, and Topmate. The focus was on understanding emotional and practical challenges faced by beginners.

Key Insights

- Learners don’t want more content — they want direction.
- Trust in mentors is more important than features.
- Short 1:1 conversations feel more valuable than long courses.
- Beginners feel emotionally lost, not just technically weak.

Persona Snapshot

Name: Aditya Verma (21)
Background: College student interested in UI/UX design.
Goal: Gain real industry guidance and build a strong portfolio.
Frustration: Overwhelmed by random tutorials and fake gurus.
Quote: “I don’t need another course. I need someone real to guide me.”

User Journey Map

The journey focuses on transforming confusion into clarity and isolation into guided growth.

- Discover – User opens SkillBridge feeling confused.
- Explore – Browses skills and mentor profiles.
- Match – Checks experience, ratings, and match percentage.
- Connect – Requests mentorship and books a free session.
- Grow – Attends sessions, builds a roadmap, and tracks progress.

UX Storyboards

Scenario 1 – Career Starter: A confused student downloads SkillBridge, explores mentors, finds a suitable match, books a free session, and feels confident after receiving guidance.

Scenario 2 – Skill Switcher: A learner who already knows basics uses SkillBridge to find a professional mentor, gets portfolio feedback, creates a learning roadmap, and tracks improvement.

Storyboards helped design the experience emotionally, not just functionally.

Low■Fidelity Prototype

Wireframes were created to define structure, mentor discovery flow, and booking process. The goal was to simplify navigation and highlight the most important actions.

Final UI Direction

The final design focuses on calm gradients, human■centered mentor cards, trust indicators, clear CTAs, and match percentage to build confidence.

Outcome & Learnings

SkillBridge demonstrates how design can reduce confusion, build trust, and support emotional growth. It highlights the importance of mentorship■driven experiences in digital learning platforms.

Key Learnings

- UX is emotional before it is functional.
- Trust is a core design feature.
- Storyboards improve design decisions.
- Human connection adds real value.

“SkillBridge turns confusion into clarity through real human guidance.”
